

- dropout

A multiband plugin to mute each band a certain percentage of the time. Each of the 4 bands is fed the main audio in and has its own multimode filter with parameters for filter type, cutoff frequency, linear gain, and resonance (or slope, depending on filter type). The cutoff frequency can also be modulated with a triangular LFO whose depth is set in semitones to give a more tonal feeling. Each band also has a probability (percentage chance) that the band will sound at a set interval. The master section sets that interval (as shown below, every eighth note).
